

WO 2004/024105

PCT/EP2003/008793

Lipid-bearing preparation, in particular cosmetic preparation

5

Description

The invention concerns a lipid-bearing preparation as set forth in claim 1, in particular in the form of a stick or a workable paste, which is
10 suitable for cosmetic uses, in particular in the field of decorative cosmetics, for coloring and improving the appearance of the skin, the lips and the eyelids. Mention may be made here by way of example of lip rouge and blusher, lipliner, eyeliner, eyebrow pencils, makeup, covering pencil, concealer or eyeshadow. It can also be used as lip care stick, lip balm, lip
15 gloss, as a fixing base for the lips, as a foundation for skin care or as a sun-protection agent. That lipid-bearing preparation is in particular in water-free form.

Preparations of the indicated kind usually contain lipids, such as for example fats, oils, oil-soluble vegetable extracts and medium-chain to long-
20 chain fatty acids and waxes which can be of vegetable or animal origin, which can be derived from mineral sources such as for example petroleum oil or which were obtained by synthesis or chemical modification of the specified substances. It is also known to use silicon-organic compounds such as for example dimethicone, phenyltrimethicone, diphenyldimethicone,
25 volatile cyclomethicones, silicone waxes and the like.

In addition they may contain a solid phase consisting of finely divided fillers and coloring agents. In the case of sun-protection agents, it is possible to use particularly finely divided pigments, so-called nanopigments, involving an average particle size of between 5 and 25 nm, which act
30 transparently on the skin and no longer color it. Mention may be made here by way of example of silicon dioxide, titanium dioxide and zinc dioxide.

Products derived from petroleum oil are not unlimitedly available as they originate from finite sources. In addition there are recommendations

from a dermatological point of view, for example from the SCF, that as a precaution no petroleum oil-based raw materials should be used in the lip region in order to avoid accumulation thereof in the gastrointestinal tract. Therefore vegetable raw materials which re-grow are to be preferred thereto. Vegetable raw materials also do not involve the questions which arise out of intensive livestock farming with subsequent use of animals.

DE 199 40 221 discloses for example a body care agent which is in the form of a free-standing stick. So that the stick retains its shape it must be of a quite specific structure, in which respect it comprises an inner core with cosmetic ingredients and is encased by a layer which is made up of proteins, polyols, softening agents and optionally cosmetic additives. The predetermined structure means that a plurality of working steps are required for manufacture.

DE 107 07 309 discloses a solid cosmetic composition which is made up from various solidified cosmetic oils. In the examples mixtures of animal and synthetic oils are used for that purpose. The disadvantage of that composition is that only very small amounts of pigments can be used, which are in a range of between only 0.1 and 4% by weight.

German patent DE 304 76 49 describes a cosmetic composition in emulsion form comprising a mixture of oils and the non-saponifiable ingredient of an oil. The composition is neither intended for nor is it suitable for being formulated in the form of a stick or paste.

In European patent application EP 0 667 146 the inventors set themselves the object of providing lip makeup in the form of a soft paste which can be applied by means of an applicator and they attained that object by providing a composition containing a wax in a fat phase, the dynamic viscosity being adjusted in a predetermined range. Preferred fat ingredients in that case are components originating from petroleum oil such as paraffin oil, vaseline, mineral oil, the use of which is precisely to be avoided with the present invention.

A publication which is concerned with a water-bearing composition for a lipstick is EP 0 522 618. A disadvantage with water-bearing

compositions is the higher level of susceptibility to bacterial contamination and thus the lower level of stability.

5 A composition comprising an oil phase and a pigment is known from US No 6 013 122. It will be noted however that this involves a liquid tattoo ink which does not permanently color but is removable. That composition is not intended to be processed to form sticks or pastes.

In order to make an oil accessible to processing in cosmetic materials, a refining process is required. A specific embodiment in that respect is described in US No 5 653 966.

10 A composition which has a high content of multiply unsaturated fatty acids is known from US No 5 445 822, which is to be processed to form a cosmetic preparation, in particular an emulsion. A disadvantage of such a composition is the low level of stability thereof.

15 The inventors of WO 02/38109 discovered that supercritical fluid extraction makes it possible to extract from *Rubus chamaemorus* ingredients which are advantageous as an addition to cosmetic compositions. The manufacture of such cosmetic products however is fairly complicated and expensive.

20 In regard to the manufacture and processing of lipid-bearing compositions of the specified kind it is to be borne in mind that they can be subjected over a prolonged period of time to relatively high temperatures in the region around between 70 and 110°C - on the one hand if the raw materials are melted and homogenised together with coloring agents and other additives and on the other hand if they are put into their definitive
25 form. In that case the raw materials used are not to experience chemical modification, or are to change chemically only to a very limited extent, due to the action of heat and oxygen in the air. Vegetable raw materials, particularly when they contain double bonds or conjugate double bonds in the carbon chain, have a tendency to experience rearrangements,
30 additions, peroxide formation and the like, which can result in negative odorous changes. Such changes can be induced or also speeded up in the sense of a catalyst action due to the presence of certain pigments. Hitherto, only a few vegetable raw materials are known, which can be processed to

afford lipid-bearing preparations of the specified kind with a satisfactory result and without adverse effects on quality.

Therefore the object of the invention was to provide a lipid-bearing preparation, in particular in the form of a stick or a workable paste, which is
5 suitable for cosmetic uses, in particular in the field of decorative cosmetics, for coloring and improving the appearance of the skin, the lips and the eyelids, which can be easily applied, which has good adhesion and lasts for a long time and which does not migrate, or migrates only to a minimal extent, from the original location of application into the immediate
10 surroundings. This preparation is to be based on purely vegetable and vegetable-based raw materials which do not suffer from the above-indicated disadvantages, but otherwise is to be as free as possible of animal raw materials, petroleum oil-based raw materials, in particular in order to avoid the known disadvantages thereof in the immediate area of the eyes.
15 In addition the aim is to provide that it is possible to forego the use of silicone oils or silicone derivatives. If the preparation is in stick form the aim is that it should be stable in respect of storage at different storage temperatures which can arise on the varying transportation routes and at the user himself and - if it is in the form of a workable paste - it is not to
20 exhibit any syneresis effects after prolonged storage.

In comparison with products in accordance with the state of the art therefore the aim is that this preparation can be applied softly and gently and in workable fashion, it does not become tight on the skin, the lids and the lips and dry them out, it has good durable adhesion, as far as possible it
25 does not transfer on to articles and textiles or other regions of the skin and in the immediate proximity of the eyes it also does not lead to irritations or other adverse sensations.

That object is attained in that there is provided a lipid-bearing preparation which is made up exclusively from vegetable or vegetable-
30 based raw materials which are at least in part to involve hydrogenated vegetable or vegetable-based raw materials.

It was surprisingly found that, by virtue of its composition, the preparation according to the invention is suitable for being cast to form

pencil or stick leads, even with pigment contents of between 40 and 50% by weight, so that sticks can be easily made from the material according to the invention. That was hitherto not possible with the known materials, using vegetable ingredients. In addition the invention provides particularly
5 stable preparations.

The object of the invention is attained by the lipid-bearing preparation defined in claim 1.

In particular in accordance with the invention there is provided a lipid-bearing preparation which has at least one oil phase and a solid phase.
10 In that respect the oil phase is made up exclusively from vegetable or vegetable-based raw materials.

The raw materials are designated using the designations known to the persons skilled in the relevant art, in accordance with the 'International Nomenclature of Cosmetic Ingredients' (referred to as 'INCI names'). The
15 following may be mentioned here by way of example: hydrogenated vegetable oils such as for example hydrogenated jojoba oil, hydrogenated cottonseed oil, hydrogenated vegetable oil, hydrogenated rapeseed oil, hydrogenated castor oil, hydrogenated coco-glycerides and similar, as well as *Magnifera indica* (mango seed oil), *Limnanthes alba* (meadowfoam seed
20 oil), *Butyrospermum parkii* (shea butter), *Macadamia ternifolia* nut oil (macadamia nut oil), *Buxus chinensis* (jojoba oil); waxes such as carnauba wax, candelilla wax, japan wax (*Rhus succedanea*), rice wax, sugar cane wax and similar.

In that respect the content of hydrogenated vegetable oils in the
25 lipid-bearing preparation is between 5 and 80% by weight, preferably between 15 and 50% by weight. The content of vegetable waxes is between 0.1 and 30% by weight, preferably between 1 and 20% by weight. The content of vegetable oils including jojoba oil (*Buxus chinensis*) which involves in the chemical sense a liquid wax is in a range of between 1 and
30 65% by weight, preferably between 5 and 45% by weight. It will be appreciated that the specifications in respect of the amounts which are used and which are preferably used are with the proviso that the total thereof is finally made up to 100% by weight.

A lipid-bearing preparation of the specified kind has proven to be particularly advantageous, which contains a combination of hydrogenated jojoba oil and *Limnanthes alba* (meadowfoam seed oil). Hydrogenated jojoba oil is commercially available and can be obtained in various levels of hydration and thus with varying levels of hardness - measured for example by needle penetration - and with varying melting points. By suitably mixing various commercially available types of product the man skilled in the relevant art can find out the mixture which is most suited to his purposes and can thus possibly adjust the end product in the optimum fashion, for example in respect of consistency and viscosity.

The amounts used of hydrogenated jojoba oil and *Limnanthes alba* (meadowfoam seed oil) should be in that respect in each case between 2 and 35% by weight and preferably between 5 and 25% by weight and should be used relative to each other in a ratio of between 1:2 and 2:1. *Limnanthes alba* (meadowfoam seed oil) is considered to be a particularly oxidation-stable and rancidity-stable vegetable oil - it was possible for that product property to be still further increased by the combination with hydrogenated jojoba oil so that the preparations according to the invention showed themselves to be surprisingly stable in respect of storage, even at elevated storage temperatures. However they are not only highly oxidation-stable but also the olfactory properties do not change over a prolonged storage time. The lipid-bearing preparations according to the invention can be used unchanged in temperature ranges of about 42°C and are storage-stable at up to about 52°C. They are also light, workable and can be uniformly applied, they have good adhesion and last for a long time without spreading on the skin to a substantial extent. Thus it is for example also possible to produce from a lipid-bearing preparation of the specified kind, cosmetic pencils with cast leads which can involve a lead diameter in the range of between 2 and 6 mm, with a pigment and solid content in a range of between 1 and about 50% by weight, preferably between 5 and 40% by weight, quite particularly preferably between 10 and 30% by weight, with respect to the total amount of the preparation. Such cosmetic pencils which, with pigment contents around between 40 and 50% by weight were

hitherto preferably produced by an extrusion method can be used in particular as lip liner, eyeliner or eyebrow pencils, because of their good coverage capability. The use of the above-mentioned combination of hydrogenated jojoba oil and *Limnanthes alba* (meadowfoam seed oil) means that lipid-bearing preparations of the specified kind with high solid contents of up to 50% by weight are accessible to the modern casting methods - in principle however it is possible for such lipid-bearing preparations also to be extruded in accordance with the known methods and then subjected to further processing with the methods which are also known to afford wood-encased cosmetic pencils.

The second essential ingredient of the preparation according to the invention is a solid phase which can comprise fillers and/or pigments. The proportion of the solid phase can be adjusted depending on the respectively desired consistency and desired effect of the material. Thus the proportion of the pigment depends inter alia on the desired color and the proportion of fillers depends on the desired consistency of the material. It is also possible to incorporate effect agents such as glittery or luminescent ingredients.

Examples of substances which can form the solid phase are for example fillers such as for example talcum, kaolin, starch and modified starch, polytetrafluoroethylene powder (Teflon), nylon powder, boronitride, insoluble metal soaps such as Mg stearate, Ca stearate, Sr stearate, Zn stearate and inorganic or organic pigments. The latter may be mentioned by way of example: titanium dioxide, zinc oxide, iron oxides, chromium oxide, chromium hydroxide, ultramarine, Berlin blue (ferric blue), mica, pearl gloss agents such as for example mica coated with titanium dioxide, colored mica coated with titanium dioxide and metal oxides, bismuth oxide chloride, coated bismuth oxide chloride, metal powder in flake form of aluminum, brass, bronze, copper, silver, gold and laking means of organic coloring agents with aluminum, barium, calcium or strontium. That list is only given by way of example and is not definitive. Those additives are implemented with the proviso that they are also approved by the respective national or regional cosmetic legislation.

The amount of the solid phase preferably depends on the maximum amount which is regulated in the individual countries by cosmetic legislation.

5 In that respect the quantitative proportions of pigments are in a range of between 1 and 50% by weight, preferably in a range of between 5 and 40% by weight and quite particularly preferably in a range of between 10 and 30% by weight. If the lipid-bearing preparation according to the invention is used as a light-protection agent it is possible to add thereto titanium dioxide and/or zinc oxide in the form of so-called 'nanopigments'
10 with particle sizes in the range of between 5 and 25 nm in an amount of between 1 and 20% by weight, preferably between 5 and 15% by weight, optionally also in combination with conventional oil-soluble UV-A and/or UV-B light filter substances which are approved by the respective national or regional legislation. All those quantities in respect of the solid phase are
15 also specified with the proviso that the total of all ingredients of the above-mentioned lipid-bearing preparation is made up to 100% by weight.

It is also possible to add to the preparation according to the invention the additives which are usual for cosmetics such as perfumes, anti-oxidants, preserving agents and the like in the amounts which are
20 necessary for effectiveness and usual for cosmetic materials. It is preferred in that respect to have recourse to such substances which are of vegetable origin.

In that respect both inorganic and also organic pigments and organic dyes are to be considered as the coloring agents.

25 A further subject of the invention is also a method of producing the lipid-bearing preparation according to the invention, as defined in claims 28 through 31.

As stated above by virtue of its particular properties the lipid-bearing preparation can be processed to form stick or pencil leads not only by
30 extrusion but also by casting. The subject of the invention is therefore a method of producing a cosmetic pencil in which the lipid-bearing preparation according to the invention is formed into a lead by casting and

then glued into wood in per se known manner and subjected to further processing to form pencils.

5 In a preferred embodiment in that respect the lipid-bearing preparation is cast at elevated temperature into a plastic casing sleeve of material which can be sharpened to a point, with a point being formed thereon. Methods for that purpose are known to the man skilled in the art.

10 By virtue of the particularly advantageous properties of the preparation according to the invention it is possible for the leads cast therefrom to be used in a rotary spindle mechanism. A further subject of the invention is therefore a method of producing a cosmetic pencil in which the lipid-bearing preparation according to the invention is cast at elevated temperature into a rotary spindle mechanism.

The preparation according to the invention can also be introduced in the form of a paste into tubes, pots and also cups.

15 The invention concerns lipid-bearing preparations, in particular in the form of a stick or pencil or a workable paste, which are applied to the skin, the semi-mucous membranes or in the proximity of mucous membranes, for example in the proximity of the eyes. In particular the lips are to be interpreted here as semi-mucous membranes. By way of example mention
20 may be made of preparations for coloring of or for care of the lips, preparations for coloring of or for care of the skin such as for example makeup, rouge, camouflage for hiding age spots or rosacea, concealer, pencils for outlining lip contours, the contours of the eyes and the eyebrows and also sun-protection products with different sun protection factors
25 (SPF), as far as so-called sun blocks, using very finely divided nanopigments or brightly colored, more highly pigmented sun blocks, which are popular for example with surfers and windsurfers as body paint.

The preparation can also be produced without the addition of coloring agents and may optionally contain so-called cosmetic active substances. It
30 is then used as lip gloss or as a fixing agent which are applied over a lipstick. If that uncolored preparation contains light protection filter, it can be used as lip protection and lip care. As is known in contrast to the skin of the body the skin of the lips does not include any pigmentation. Suitable

oil-soluble light filter substances which afford good protection in the UV-A and UV-B range are known in adequate numbers to the man skilled in the relevant art and are regulated by the respective national or regional legislation for example in the EU, in Japan and in the USA - in Germany for example by Appendix 7 to Regulation 3b of the Cosmetics Regulations and they are therefore not to be comprehensively listed here. Therefore mention will only be made by way of example of isoamyl p-methoxycinnamate as a UV-B filter, and 4-methylbenzylidene camphor as a UV-A filter.

The preparation according to the invention will now be described in detail by means of the Examples hereinafter, which however do not definitively describe the invention. In this respect all amounts are stated in percent by weight (% by weight) with respect to the total weight of the preparation:

Example 1 - Pasty lip rouge

Hydrogenated jojoba oil	11.000
Limnanthes alba	19.500
Carnauba	3.500
Buxus chinensis	31.550
Butyrospermum parkii	3.000
Hydrogenated cottonseed oil	9.500
Pigments	18.000
Silica	3.500
Tocopherol	0.350
Ascorbyl palmitate	0.100

Production is effected by a procedure whereby hydrogenated jojoba oil, Limnanthes alba (meadowfoam seed oil), carnauba, Buxus chinensis and hydrogenated cottonseed oil are put in a suitable homogenising machine with an anchor-type agitator and gear ring homogeniser and heated to about 90°C. The silica is then sprinkled in and dispersed by means of the homogeniser. The pigments are then added and the mixture is then homogenised under a high input of shearing force in order to

destroy all pigment agglomerates. The mass is then deaerated by the application of vacuum. Then the anti-oxidants (tocopherol and ascorbyl palmitate) are added to the mixture while still hot and it is then subjected to brief post-homogenisation. The mixture is then cooled down further to about 35°C with agitation with the anchor-type agitator. The mixture which is now pasty is transferred into the filling vessel and allowed to cool down to ambient temperature, without further measures. Then on a filling or assembly machine it is introduced into the appropriate vessels such as for example pots of glass or plastic material or bowls of metal after the preparation has been checked by quality assurance and passed. The result obtained is a workable soft paste of a viscosity of 5000 mPas.

Example 2 - Cream eyeshadow

	Candelilla cera	2.500
	Carnauba	1.800
15	Hydrogenated castor oil	3.500
	Hydrogenated jojoba oil	9.500
	Limnanthes alba	18.000
	Hydrogenated cottonseed oil	4.000
	Buxus chinensis	32.250
20	Pigments	9.000
	Mica (and) titanium dioxide	16.000
	Silica	3.000
	Tocopherol	0.350
	Ascorbyl palmitate	0.100

25

Production is effected in a similar manner to Example 1 but in this case firstly the pigments are added to the fat phase at about 90°C and homogeneously worked thereinto, thereafter the pearl gloss agents are added and it is then briefly homogenised once again. The result obtained is

30 a soft workable paste with a nice pearl gloss and a viscosity of 4200 mPas.

Example 3 - Lipgloss

	Carnauba	1.650
	Candelilla cera	2.000

	Limnanthes alba	16.000
	Hydrogenated jojoba oil	8.750
	Magnifera indica	6.000
	Macadamia ternifolia nut oil	7.500
5	Butyrosperum parkii	2.000
	Buxus chinensis	44.550
	Rhus succedanea	6.000
	Silica	2.500
	Isoamyl p-methoxycinnamate	1.500
10	4-Methylbenzylidene camphor	1.000
	Tocopherol	0.450
	Ascorbyl palmitate	0.100

- 15 Production is effected substantially similarly to the above-described methods, wherein the light filter substances are added together with the tocopherol at about 45 - 50°C. The result obtained is an uncolored, transparent, very soft paste, with a viscosity of 2800 mPas, which can be introduced into tubes or pots.

Example 4 - Sun block for surfers

20	Carnauba	3.500
	Candelilla cera	2.850
	Hydrogenated castor oil	4.800
	Hydrogenated vegetable oil	7.500
	Hydrogenated jojoba oil	9.500
25	Limnanthes alba	16.000
	Buxus chinensis	23.550
	Magnifera indica	5.000
	Titanium dioxide (nanopigment)	10.000
	Iron oxides (red and yellow)	6.000
30	Silica	3.000
	Isoamyl p-methoxycinnamate	4.500
	4-Methylbenzylidene camphor	3.000
	Tocopherol	1.000

Ascorbyl palmitate

0.100

- Production is effected in accordance with the method specified in Example 1. The result obtained is a red-orange solid preparation which is preferably suitable for being introduced into rotary spindle mechanisms. The sun protection factor (SPF) of that preparation is above 25.

Example 5 - Lipliner

	Hydrogenated jojoba oil	34.000
	Limnanthes alba	20.000
10	Carnauba	0.800
	Candelilla cera	2.500
	Magnifera indica	4.000
	Butyrospermum parkii	1.000
	Silica	8.300
15	Chamomilla recuita	1.000
	Tocopherol	0.300
	Pigments	28.000
	Ascorbyl palmitate	0.100

- Production of the lipliner is effected similarly to Example 1. The material is transferred into a casting machine and at about 85 - 90°C either cast into plastic casing sleeves comprising a material which can be sharpened to a point, with a point being formed thereon, or is cast into metal casting molds and, after becoming cold, is removed from the mold and subjected to further processing again in known manner to form wood-encased cosmetic pencils.

Example 6 - Eyeliner

	Hydrogenated jojoba oil	11.000
	Limnanthes alba	19.500
30	Hydrogenated vegetable oil	4.500
	Buxus chinensis	8.400
	Carnauba	1.700
	Candelilla cera	2.650

	Rhus succedanea	4.500
	Magnifera indica	4.000
	Macadamia ternifolia nut oil	1.900
	Pigments	30.000
5	Talcum	6.700
	Silica	3.000
	Glyceryl caprylate	1.000
	Chamomilla recutita extract	0.800
	Tocopherol	0.250
10	Ascorbyl palmitate	0.100

Production of the eyeliner is effected in a similar manner to the procedure set out in Example 5. The pigments which are particularly preferably used are inorganic pigments such as black, red and yellow iron oxides, titanium dioxide, ferric blue, ultramarine, chromium hydroxide green, chromium oxide green, manganese violet and mixtures thereof. It is optionally also possible to use pearl gloss pigments such as for example mica, mica coated with metal oxides, bismuth oxychloride, bismuth oxychloride coated with metal oxides, metals in flake form such as powder-form aluminum, bronze, brass, titanium, silver, gold or mixtures thereof, also in combination with inorganic pigments.

Example 7 - Eyebrow pencil

	Hydrogenated jojoba oil	12.500
	Limnanthes alba	10.500
25	Rhus succedanea	6.000
	Hydrogenated cottonseed oil	6.000
	Carnauba	2.200
	Candelilla cera	2.600
	Butyrospermum parkii	1.250
30	Macadamia ternifolia nut oil	2.200
	Buxus chinensis	6.300
	Pigments	35.000
	Talcum	12.000

Silica	3.000
Tocopherol	0.350
Ascorbyl palmitate	0.100

5 Production is effected similarly to Example 1. After the material is completely cold the material is also passed twice by way of a three-roll mill, put into cartridge form in known manner and extruded in a conventional procedure to afford leads which are then glued into wood stick portions and subjected to processing to provide finished wood-encased pencils.

10 Lipid-bearing preparations which do not contain any water phase very often remain unpreserved in order as far as possible to exclude incompatibility reactions - which are comparatively very rare - on the part of lady consumers to preserving agents. In order however to exclude colonisation of the pencil surfaces with micro-organisms with subsequent

15 re-contamination of the surface of the skin, it is possible to add to the lipid-bearing preparations according to the invention, vegetable-based preserving agents such as for example oil-soluble dry extract of rosemary or glyceryl caprate or mixtures of natural perfumes or perfumes which are identical to nature, with anti-microbial properties, such as for example

20 geraniol, linalool, neroli, vanillin, eugenol, methyleugenol, palmarosa oil and the like in the desired and conventional amounts of between 0.05 and 1.0% by weight. Preferably the necessary amount of preserving agent is determined in a preservation loading test which is sufficiently known to the persons skilled in the art who are relevantly concerned with this aspect.

25
